

### Lecture 5: Random Variable, Part III

Yi, Yung (이용)

EE210: Probability and Introductory Random Processes KAIST EE

April 27, 2021

April 27, 2021 1 / 39

## Roadmap

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs.
- (4) Correlation coefficient
- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs.

- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

L5(1) April 27, 2021 3 / 39

# Derived Distribution: Y = g(X)

- Given the PDF of X, What is the PDF of Y = g(X)?
- Wait! Didn't we cover this topic? No. We covered just  $\mathbb{E}[g(X)]$ .
- Examples: Y = X, Y = X + 1,  $Y = X^2$ , etc.
- What are easy or difficult cases?
- Easy cases
  - Discrete
  - Linear: Y = aX + b

L5(1) April 27, 2021 4 / 39

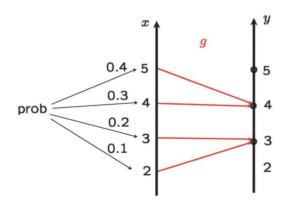

### Discrete Case

• Take all values of x such that g(x) = y, i.e.,

$$p_Y(y) = \mathbb{P}(g(X) = y)$$
$$= \sum_{x:g(x)=y} p_X(x)$$

$$p_Y(3) = p_X(2) + p_X(3) = 0.1 + 0.2 = 0.3$$
  
 $p_Y(4) = p_X(4) + p_X(5) = 0.3 + 0.4 = 0.7$ 

L5(1) April 27, 2021 5 / 39

# Linear: Y = aX + b, $a \neq 0$ , X: Continuous

If 
$$a > 0$$
,  $F_Y(y) = \mathbb{P}(aX + b \le y) = \mathbb{P}(X \le \frac{y - b}{a}) = F_X(\frac{y - b}{a})$   

$$\to f_Y(y) = \frac{1}{a}f_X\left(\frac{y - b}{a}\right)$$
If  $a < 0$ ,  $F_Y(y) = \mathbb{P}(aX + b \le y) = \mathbb{P}(X \ge \frac{y - b}{a}) = 1 - F_X(\frac{y - b}{a})$ 

$$f_Y(y) = -\frac{1}{a}f_X\left(\frac{y-b}{a}\right)$$

Therefore,

$$f_Y(y) = \frac{1}{|a|} f_X\left(\frac{y-b}{a}\right)$$

L5(1) April 27, 2021 6 / 39

# Linear: Y = aX + b, when X is exponential

$$f_X(x) = egin{cases} \lambda e^{-\lambda x}, & ext{if} \quad x \geq 0 \\ 0, & ext{otherwise} \end{cases}$$

$$f_Y(y) = egin{cases} rac{\lambda}{|a|} e^{-\lambda(y-b)/a}, & ext{if} & (y-b)/a \geq 0 \ 0, & ext{otherwise} \end{cases}$$

• If b=0 and a>0, Y is exponential with parameter  $\frac{\lambda}{a}$ , but generally not.

L5(1) April 27, 2021 7 / 3

# Linear: Y = aX + b, when X is normal

· Remember? Linear transformation preserves normality. Time to prove.

If 
$$X \sim \mathcal{N}(\mu, \sigma^2)$$
, then for  $a \neq 0$  and  $b, Y = aX + b \sim \mathcal{N}(a\mu + b, a^2\sigma^2)$ .

Proof.

$$f_X(x) = \frac{1}{\sqrt{2\pi}} e^{-(x-\mu)^2/2\sigma^2}$$

$$f_Y(y) = \frac{1}{|a|} f_X\left(\frac{y-b}{a}\right) = \frac{1}{|a|} \frac{1}{\sqrt{2\pi}} \exp\left\{-\left(\frac{y-b}{a} - \mu\right)^2 / 2\sigma^2\right\}$$
$$= \frac{1}{\sqrt{2\pi}|a|\sigma} \exp\left\{-\frac{(y-b-a\mu)^2}{2a^2\sigma^2}\right\}$$

L5(1) April 27, 2021 8 / 39

# Generally, Y = g(X), X: Continuous

Step 1. Find the CDF of Y:

$$F_Y(y) = \mathbb{P}(Y \le y) = \mathbb{P}(g(X) \le y)$$

Step 2. Differentiate:  $f_Y(y) = \frac{dF_Y}{dy}(y)$ 

Ex1.  $Y = X^2$ .

$$F_Y(y) = \mathbb{P}(X^2 \le y) = \mathbb{P}(-\sqrt{y} \le X \le \sqrt{y})$$
  
=  $F_X(\sqrt{y}) - F_X(-\sqrt{y})$ 

$$f_Y(y) = \frac{1}{2\sqrt{y}}f_X(\sqrt{y}) +$$

$$\frac{1}{2\sqrt{y}}f_X(-\sqrt{y}), \quad y \ge 0$$

Ex2.  $X \sim \mathcal{U}[0, 1]. \ Y = \sqrt{X}.$ 

$$F_Y(y) = \mathbb{P}(\sqrt{X} \le y) = \mathbb{P}(X \le y^2) = y^2$$
  
$$f_Y(y) = 2y, \quad 0 \le y \le 1$$

Ex3.  $X \sim \mathcal{U}[0, 2]$ .  $Y = X^3$ .

$$F_Y(y) = \mathbb{P}(X^3 \le y) = \mathbb{P}(X \le \sqrt[3]{y}) = \frac{1}{2}y^{1/3}$$
  
 $f_Y(y) = \frac{1}{6}y^{-2/3}, \quad 0 \le y \le 8$ 

When Y = g(X) is monotonic, a general formula can be drawn (see the textbook at pp 207)

L5(1)

April 27, 2021 9 / 39

# Functions of multiple rvs: Z = g(X, Y) (1)

Basically, follow two-step approach: (i) CDF and (ii) differentiate.

Ex1.  $X, Y \sim \mathcal{U}[0, 1]$ , and  $X \perp \!\!\!\perp Y$ .  $Z = \max(X, Y)$ .

\* 
$$\mathbb{P}(X \leq z) = \mathbb{P}(Y \leq z) = z, \ z \in [0,1].$$

$$F_{Z}(z) = \mathbb{P}(\max(X, Y) \le z) = \mathbb{P}(X \le z, Y \le z)$$
$$= \mathbb{P}(X \le z)\mathbb{P}(Y \le z) = z^{2} \qquad \text{(from } X \perp \!\!\!\perp Y)$$

$$f_Z(z) = egin{cases} 2z, & ext{if } 0 \leq z \leq 1 \ 0, & ext{otherwise} \end{cases}$$

L5(1) April 27, 2021 10 / 39

# Functions of multiple rvs: Z = g(X, Y) (2)

Basically, follow two step approach: (i) CDF and (ii) differentiate.

Ex2.  $X, Y \sim \mathcal{U}[0, 1]$ , and  $X \perp \!\!\! \perp Y$ . Z = Y/X.

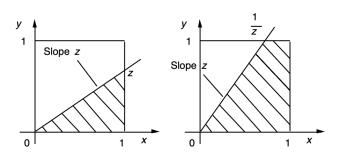

VIDEO PAUSE

$$F_Z(z) = \mathbb{P}(Y/X \le z)$$

$$= \begin{cases} z/2, & 0 \le z \le 1 \\ 1 - 1/2z, & z > 1 \\ 0, & \text{otherwise} \end{cases}$$

$$f_Z(z) = egin{cases} 1/2, & 0 \leq z \leq 1 \ 1/(2z^2), & z > 1 \ 0, & ext{otherwise} \end{cases}$$

- Depending on the value of z, two cases need to be considered separately.

(Note) Sometimes, the problem is tricky, which requires careful case-by-case handing. :-)

L5(1) April 27, 2021 11 / 39

# Roadmap

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs.
- (4) Correlation coefficient
- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

L5(2) April 27, 2021 12 / 39

## Functions of multiple rvs: Z = X + Y, $X \perp \!\!\!\perp Y$

**KAIST EE** 

- A very basic case with many applications
- Assume that  $X, Y \in \mathbb{Z}$

$$p_{Z}(z) = \mathbb{P}(X + Y = z)$$

$$= \sum_{\{(x,y): x+y=z\}} \mathbb{P}(X = x, Y = y)$$

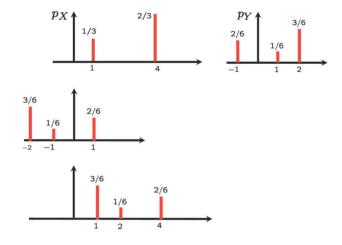

$$= \sum_{x} \mathbb{P}(X = x, Y = z - x)$$

$$= \sum_{x} \mathbb{P}(X = x) \mathbb{P}(Y = z - x)$$

$$= \sum_{x} p_{X}(x) p_{Y}(z - x)$$

•  $p_Z(z)$  is called **convolution** of the PMFs of X and Y.

- Interpretation (for a given z)
- (i) Flip (horizontally)  $p_Y(y)$  ( $p_Y(-x)$ )
- (ii) Put it underneath  $p_X(x)$   $(p_Y(-x+z))$

L5(2) April 27, 2021 13 / 39

## Y = X + Y, $X \perp \!\!\!\perp Y$ : Continuous

• Same logic as the discrete case

$$f_Z(z) = \int_{-\infty}^{\infty} f_X(x) f_Y(z - x) dx$$

• Example.  $X, Y \sim \mathcal{U}[0,1]$  and  $X \perp \!\!\! \perp Y$ . What is the PDF of Z = X + Y?

L5(2) April 27, 2021 14 / 39

# $Y = X + \overline{Y, X \perp \!\!\!\perp Y, Normal} (1)$

- Very special, but useful case
  - X and Y are normal.

### Sum of two independent normal rvs

$$X \sim \mathcal{N}(\mu_x, \sigma_x^2)$$
 and  $Y \sim \mathcal{N}(\mu_x, \sigma_x^2)$  Then,  $X + Y \sim \mathcal{N}(\mu_x + \mu_y, \sigma_x^2 + \sigma_y^2)$ 

- Why normal rvs are used to model the sum of random noises.
- Extension. The sum of finitely many independent normals is also normal.

L5(2) April 27, 2021 15 / 39

# Y = X + Y, $X \perp \!\!\!\perp Y$ , Normal (2)

$$f_{Z}(z) = \int_{-\infty}^{\infty} f_{X}(x) f_{Y}(z - x) dx$$

$$= \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}\sigma_{x}} \exp\left\{-\frac{(x - \mu_{x})^{2}}{2\sigma_{x}^{2}}\right\} \frac{1}{\sqrt{2\pi}\sigma_{y}} \exp\left\{-\frac{(z - x - \mu_{y})^{2}}{2\sigma_{y}^{2}}\right\} dx$$

• The details of integration is a little bit tedious, but note where we use the independence condition.

$$f_Z(z) = \frac{1}{\sqrt{2\pi(\sigma_x^2 + \sigma_y^2)}} \exp\left\{-\frac{(z - \mu_x - \mu_y)^2}{2(\sigma_x^2 + \sigma_y^2)}\right\}$$

L5(2) April 27, 2021 16 / 39

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs
- (4) Correlation coefficient
- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

L5(3) April 27, 2021 17 / 39

## Dependence Degree: Motivating Example

• covariance의 필요성을 이야기해주는 example을 찿아서 먼저 이야기를 해준다.

L5(3) April 27, 2021 18 / 39

## Making a Metric of Dependence Degree

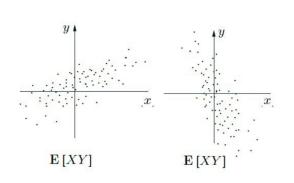

- Goal: Given two rvs X and Y, assign some number that quantifies the degree of their dependence
- Reqs.
  - a) Increases (resp. decreases) as they become more (resp. less) dependent.
  - b) 0 when they are independent.
  - c) Shows the direction of dependence by + and -
  - d) Always bounded by some numbers, e.g., [-1,1]
- Good engineers: Good at making good metrics
  - Metric of how our society is economically polarized
  - A lot of metrics in our professional sports leagues (baseball, basketball, etc)
  - Cybermetrics in MLB (Major League Baseball):
     http://m.mlb.com/glossary/advanced-stats

L5(3) April 27, 2021 19 / 39

# OK. Let's Design!

- Simple case:  $\mathbb{E}[X] = \mu_{\scriptscriptstyle X} = 0$  and  $\mathbb{E}[Y] = \mu_{\scriptscriptstyle Y} = 0$
- Dependent: Positive (If  $X \uparrow$ ,  $Y \uparrow$ ) or Negative (If  $X \uparrow$ ,  $Y \downarrow$ )
- What about  $\mathbb{E}[XY]$ ? Seems good.
  - $\circ \mathbb{E}[XY] = \mathbb{E}[X]\mathbb{E}[Y] = 0 \text{ when } X \perp \!\!\!\perp Y$
  - $\circ$  More data points (thus increases) when xy > 0 (both positive or negative)

(Q) What about  $\mathbb{E}[X + Y]$ ?

L5(3) April 27, 2021 20 / 39

# What If $\mu_X \neq 0, \mu_Y \neq 0$ ?

• Solution: Centering.  $X o X - \mu_X$  and  $Y o Y - \mu_Y$ 

### Covariance

$$\operatorname{\mathsf{cov}}(X,Y) = \mathbb{E}\Big[(X - \mathbb{E}[X]) \cdot (Y - \mathbb{E}[Y])\Big]$$

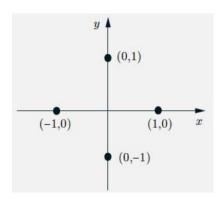

- After some algebra,  $cov(X, Y) = \mathbb{E}[XY] \mathbb{E}[X]\mathbb{E}[Y]$
- $X \perp \!\!\!\perp Y \Longrightarrow \operatorname{cov}(X,Y) = 0$
- $cov(X, Y) = 0 \Longrightarrow X \perp \!\!\!\perp Y$ ? NO.
- When cov(X, Y) = 0, we say that X and Y are uncorrelated.

L5(3) April 27, 2021 21 / 39

# Example: cov(X, Y) = 0, but not independent

- $p_{X,Y}(1,0) = p_{X,Y}(0,1) = p_{X,Y}(-1,0) = p_{X,Y}(0,-1) = 1/4.$
- $\mathbb{E}[X] = \mathbb{E}[Y] = 0$ , and  $\mathbb{E}[XY] = 0$ . So, cov(X, Y) = 0
- Are they independent? No, because if X = 1, then we should have Y = 0.

L5(3) April 27, 2021 22 / 39

### Some Properties

$$cov(X,X)=0$$

$$cov(aX + b, Y) = \mathbb{E}[(aX + b)Y] - \mathbb{E}[aX + b]\mathbb{E}[Y] = a \cdot cov(X, Y)$$

$$cov(X, Y + Z) = \mathbb{E}[X(Y + Z)] - \mathbb{E}[X]\mathbb{E}[Y + Z] = cov(X, Y) + cov(X, Z)$$

$$var[X + Y] = \mathbb{E}[(X + Y)^2] - (\mathbb{E}[X + Y])^2 = var[X] + var[Y] - 2cov(X, Y)$$

L5(3) April 27, 2021 23 / 39

# Example: The hat problem in Lecture 3. Remember?

- n people throw their hats in a box and then pick one at random
- X: number of people with their own hat
- (Q) var[X]
- Key step 1. Define a rv  $X_i = 1$  if i selects own hat and 0 otherwise. Then,  $X = \sum_{i=1}^{n} X_i$ .
- Key step 2. Are  $X_i$ s are independent?
- $X_i \sim Bernoulli(1/n)$ . Thus,  $\mathbb{E}[X_i] = 1/n$  and  $var[X_i] = \frac{1}{n}(1 \frac{1}{n})$

• For  $i \neq j$ ,

$$\begin{aligned} \text{cov}(X_i, X_j) &= \mathbb{E}[X_i X_j] - \mathbb{E}[X_i] \mathbb{E}[X_j] \\ &= \mathbb{P}(X_i = 1 \text{ and } X_j = 1) - \frac{1}{n^2} \\ &= \mathbb{P}(X_i = 1) \mathbb{P}(X_j = 1 | X_i = 1) - \frac{1}{n^2} \\ &= \frac{1}{n} \frac{1}{n-1} - \frac{1}{n^2} = \frac{1}{n^2(n-1)} \end{aligned}$$

$$var[X] = var\left[\sum X_i\right]$$

$$= \sum var[X_i] + \sum_{i \neq j} cov(X_i, X_j)$$

$$= n\frac{1}{n}(1 - \frac{1}{n}) + n(n - 1)\frac{1}{n^2(n - 1)} = 1$$

L5(3) April 27, 2021 24 / 39

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs
- (4) Correlation coefficient
- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

L5(4) April 27, 2021 25 / 39

### Bounding the metric: Correlation Coefficient

- Reqs. a), b), and c) satisfied.
  - d) Always bounded by some numbers, e.g., [-1, 1]
- Dimensionless metric. How? Normalization, but by what?

### Correlation Coefficient

$$\rho(X,Y) = \mathbb{E}\left[\frac{(X - \mu_X)}{\sigma_X} \cdot \frac{(Y - \mu_Y)}{\sigma_Y}\right] = \frac{\text{cov}(X,Y)}{\sqrt{\text{var}[X]\text{var}[Y]}}$$

- $-1 \le \rho \le 1$
- $|\rho| = 1 \Longrightarrow X \mu_X = c(Y \mu_Y)$  (linear relation, VERY related)

L5(4) April 27, 2021 26 / 39

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs
- (4) Correlation coefficient
- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

L5(5) April 27, 2021 27 / 39

# A Special Random Variable

• Consider a rv Y, such that

$$Y = \begin{cases} 0, & \text{w.p. } 1/4 \\ 1, & \text{w.p. } 1/4 \\ 2, & \text{w.p. } 1/2 \end{cases}$$

• If  $h(y) = y^2$ , then a new rv h(Y) is:

$$h(Y) = \begin{cases} 0, & \text{w.p. } 1/4 \\ 1, & \text{w.p. } 1/4 \\ 4, & \text{w.p. } 1/2 \end{cases}$$

Consider other rv X, such that

$$g(y) = \mathbb{E}[X|Y = y] = \begin{cases} 3, & \text{if } y = 0 \\ 8, & \text{if } y = 1 \\ 9, & \text{if } y = 2 \end{cases}$$

• Then, a rv g(Y) is:

$$g(Y) = \begin{cases} 3, & \text{w.p. } 1/4 \\ 8, & \text{w.p. } 1/4 \\ 9, & \text{w.p. } 1/2 \end{cases}$$

- The rv g(Y) looks special, so let's give a fancy notation to it.
- What about?  $X_{exp}(Y)$ ,  $\mathbb{E}[X_Y]$ ,  $\mathbb{E}_X[Y]$ ?

L5(5) April 27, 2021 28 / 39

# Conditional Expectation $\mathbb{E}[X|Y]$

### Conditional Expectation

A random variable  $g(Y) = \boxed{\mathbb{E}[X|Y]}$ , called conditional expectation of X given Y takes the value  $g(y) = \mathbb{E}[X|Y = y]$ , if Y happens to take the value y.

- A function of Y
- A random variable
- Thus, having a distribution, expectation, variance, all the things that a random variable has.
- Often confusing because of the notation.

L5(5) April 27, 2021 29 / 39

## Expectation of $\mathbb{E}[X|Y]$

### **Expectation of Conditional Expectation**

$$\mathbb{E}\big[\mathbb{E}[X|Y]\big] = \mathbb{E}[X],$$
 Law of iterated expectations

#### Proof.

$$\mathbb{E}\Big[\mathbb{E}[X|Y]\Big] = \sum_{y} \mathbb{E}[X|Y = y] \rho_{Y}(y)$$
$$= \mathbb{E}[X]$$

L5(5) April 27, 2021 30 / 39

### **Examples and Meaning**

- Stick of length I
- Uniformly break at point Y, and break what is left uniformly at point X.
- $\mathbb{E}[X|Y=y]=y/2$
- $\mathbb{E}[X|Y] = Y/2$
- $\mathbb{E}[X] = \mathbb{E}[\mathbb{E}[X|Y]] = \mathbb{E}[Y/2] = \frac{1}{2}\frac{I}{2} = I/4$

- Forecasts on sales: calculating expected value, given any available information
- X : February sales
- Forecast in the beg. of the year:  $\mathbb{E}[X]$
- End of Jan. new information Y = y
   (Jan. sales)
   Revised forecast: E[X|Y = y]
   Revised forecast ≠ E[X]
- Law of iterated expectations  $\mathbb{E}[\text{revised forecast}] = \text{original one}$

L5(5) April 27, 2021 31 / 39

# Roadmap

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs
- (4) Correlation coefficient
- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

## Conditional Variance var[X|Y]

$$var[X] = \mathbb{E}[(X - \mathbb{E}[X])^2]$$

$$var[X|Y = y] = \mathbb{E}[(X - \mathbb{E}[X|Y = y])^2|Y = y]$$

### Conditional Variance

A random variable g(Y) = var[X|Y] and called conditional variance of X given Y takes the value g(y) = var[X|Y = y], if Y happens to take the value y.

- A function of Y
- A random variable
- Thus, having a distribution, expectation, variance, all the things that a random variable has

L5(6) April 27, 2021 33 / 39

# Expectation and Variance of $\mathbb{E}[X|Y]$ and var[X|Y]

	$\Big  \mathbb{E}[X Y]$	var[X Y]
Expectation	$\Big  \mathbb{E}\Big[\mathbb{E}(X Y)\Big]$	$\mathbb{E}\Big[var(X Y)\Big]$
Variance	$varigl[\mathbb{E}(X Y)igr]$	var[var(X Y)]

L5(6) April 27, 2021 34 / 39

### Law of Total Variance

### Law of total variance

$$\mathsf{var}[X] = \mathbb{E}\Big[\mathsf{var}(X|Y)\Big] + \mathsf{var}[\mathbb{E}(X|Y)]$$

Proof.

$$\operatorname{\mathsf{var}}(X|Y) = \mathbb{E}[X^2|Y] - (\mathbb{E}[X|Y])^2$$

$$\mathbb{E}\left[\operatorname{var}(X|Y)\right] = \mathbb{E}[X^2] - \mathbb{E}\left[\left(\mathbb{E}[X|Y]\right)^2\right] \tag{1}$$

$$\operatorname{var}\left[\mathbb{E}(X|Y)\right] = \mathbb{E}\left[\left(\mathbb{E}[X|Y]\right)^{2}\right] - \left(\mathbb{E}\left[\mathbb{E}(X|Y)\right]\right)^{2} = \mathbb{E}\left[\left(\mathbb{E}[X|Y]\right)^{2}\right] - \left(\mathbb{E}[X]\right)^{2} \tag{2}$$

$$(1) + (2) = \mathbb{E}[X^2] + (\mathbb{E}[X])^2 = \text{var}[X]$$

L5(6) April 27, 2021 35 / 39

# Roadmap

- (1) Derived distribution of Y = g(X) or Z = g(X, Y)
- (2) Derived distribution of Z = X + Y
- (3) Covariance: Degree of dependence between two rvs
- (4) Correlation coefficient
- (5) Conditional expectation and law of iterative expectations
- (6) Conditional variance and law of total variance
- (7) Random number of sum of random variables

L5(6) April 27, 2021 36 / 39

### Sum of a random number of rvs

- N : number of stores visited (random)
- $X_i$ : money spent in store i, independent of other  $X_j$  and N,  $X_i$ s are identically distributed with  $\mathbb{E}[X_i] = \mu$
- $Y = X_1 + X_2 + \dots X_N$ . What are  $\mathbb{E}[Y]$  and var[Y]?
- $\mathbb{E}[Y] = \mathbb{E}[\mathbb{E}[Y|N]] = \mathbb{E}[N\mathbb{E}[X_i]] = \mathbb{E}[N]\mathbb{E}[X_i] = \mu\mathbb{E}[N]$
- $\operatorname{var}[Y] = \mathbb{E}\left[\operatorname{var}(Y|N)\right] + \operatorname{var}\left[\mathbb{E}(Y|N)\right] = \mathbb{E}[N]\operatorname{var}[X_i] \mu^2\operatorname{var}[N]$   $\operatorname{var}(\mathbb{E}[Y|N]) = \operatorname{var}(N\mu) = \mu^2\operatorname{var}[N]$   $\operatorname{var}[Y|N] = N\operatorname{var}[X_i]$   $\mathbb{E}[\operatorname{var}(Y|N)] = \mathbb{E}[N\operatorname{var}[X_i]] = \mathbb{E}[N]\operatorname{var}[X_i]$

L5(6) April 27, 2021 37 / 39

## Questions?

L5(6) April 27, 2021 38 / 39

### Review Questions

- 1) What are the key steps to get the derived distributions of Y = g(X) or Z = g(X, Y)?
- 2) How can we compute the distribution of Z + X + Y when X and Y are independent?
- 3) What are covariance and correlation coefficient? Why do we need them?
- 4) Please explain the concepts of conditional expectation and conditional variance.

L5(6) April 27, 2021 39 / 39
